

# Navigating Peer to peer Audits A Student's Guide

Welcome! This presentation will guide you through our peer to peer audit process.

**Purpose :**

- You'll learn what audits are
- Why they're important
- how to make them a valuable learning experience

**Audits** focus on understanding and ownership, not technical nitpicking.  
Clear explanations matter more than reading code line by line.

# Why We Do Audits

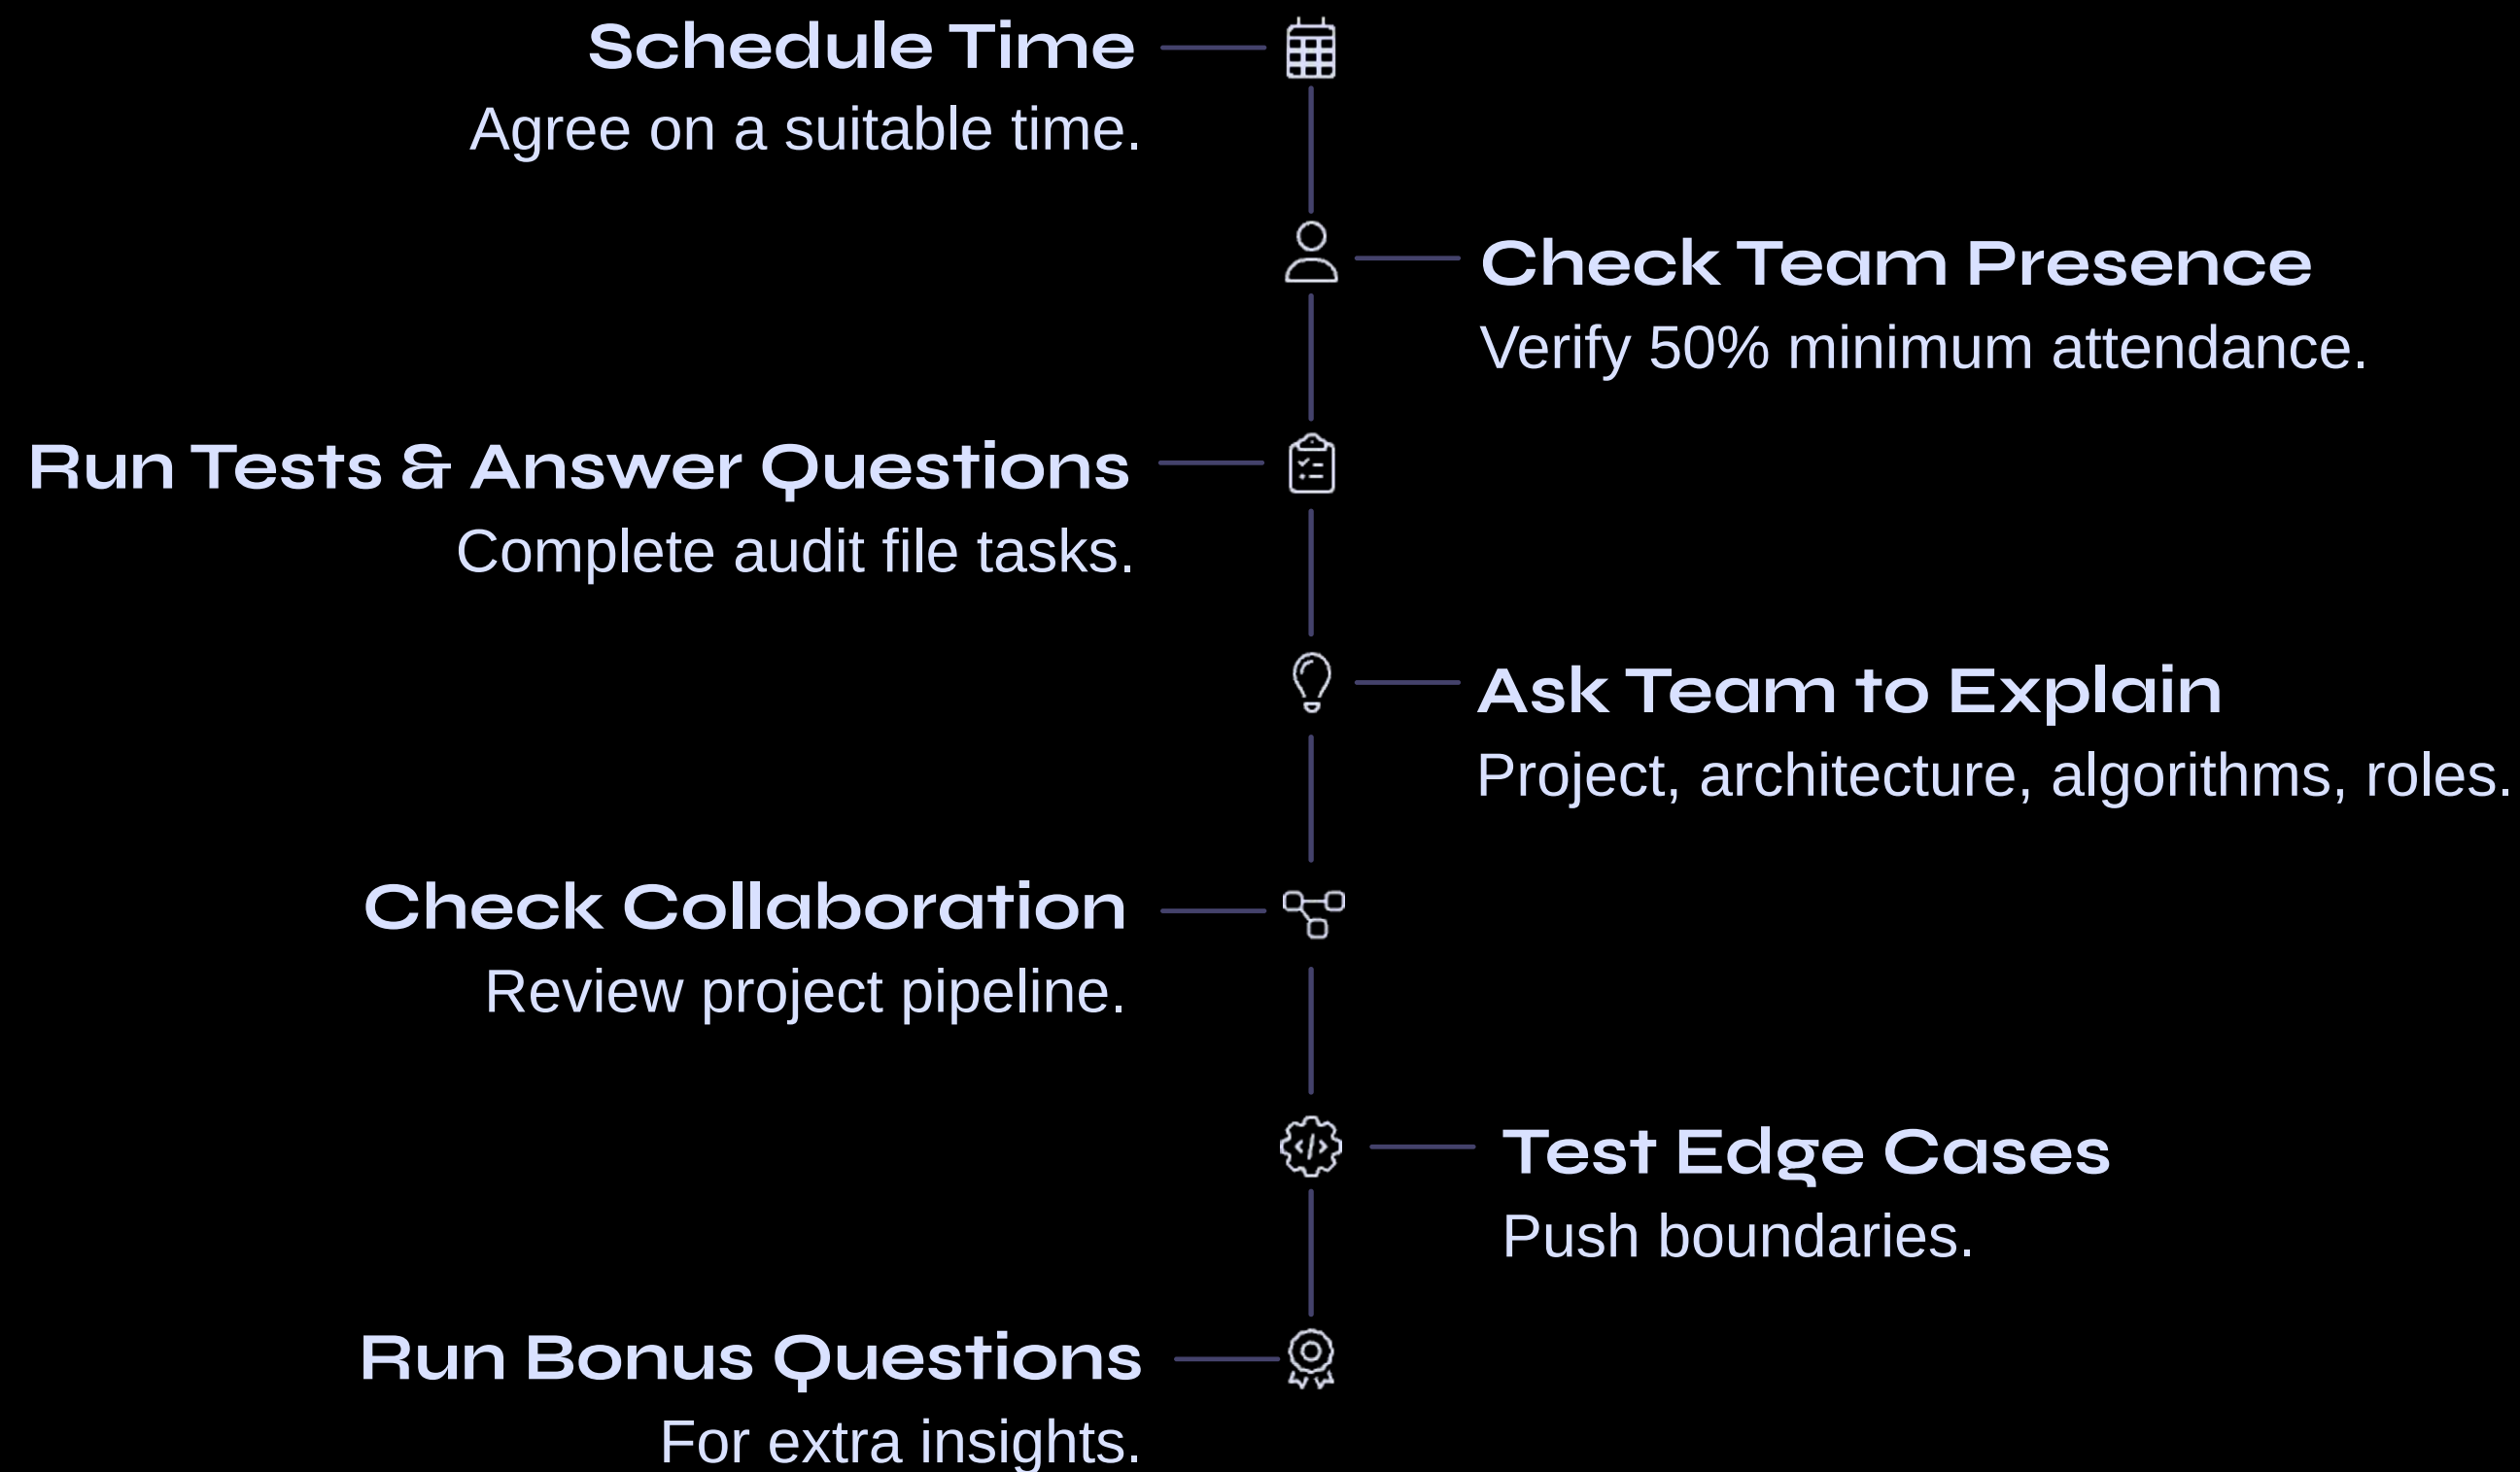

Audits help you grow technically and socially by exchanging ideas, feedback, and responsibility. Consistent participation builds a robust portfolio for future employers, including vital documentation.

-  **Evaluate Project Goals**  
Ensure projects meet defined objectives.
-  **Encourage Exchange**  
Foster meaningful discussion and learning.
-  **Give/Receive Feedback**  
Practice structured feedback delivery.
-  **Build Real-World Skills**  
Develop essential soft skills for your career.

# Step-by-Step Audit Flow

# When Does an Audit Fail?

- Less than 50% team present
- Code fails audit tests
- Team can't explain project logic
- Students can't explain contributions

Audits fail when there's weak participation, lack of understanding, or if the project doesn't work, hindering the learning process.

# Benefits for Audits

## Learn New Methods

Expand your technical toolkit

## Prepare for Future Projects

Gain experience for upcoming tasks.

## Build Leadership & Conflict Skills

Practice guiding discussions and resolving disagreements.

Auditors sharpen soft skills, expand their tech toolkit, and prepare for real-world reviews, making them well-rounded professionals.

# Dos and Don'ts

## Dos:

- Be respectful and follow the subject
- Give fair answers and ask for help if needed
- When in doubt, try to discuss it
- Audit questions can be vague on purpose — they're meant to spark discussion
- Always include README files and clear comments
- Learn from the first project how to include tests in your work

## Don'ts:

- Fail questions based on subjective opinions
- Contact the Bocal unless all meaningful discussion has truly failed
- Only learn the part you wrote — understand the full project
- Get defensive when receiving feedback

# It's Not About Being Right

Auditors are not judges.

They validate project specs.

Code line by line review isn't always needed.

Your audits are supposed to fail now and then.

**DO NOT** treat this as an attempt to slow your progress

It is an integral part of the **LEARNING EXPERIENCE**

# BOCAL AUDITS

Finishing a group of projects you have bocal audits.

## *RULES:*

### → **Bocals can go beyond audit questions:**

Expect deeper questions, about understanding, decisions, teamwork.

### → **Book a slot:**

All team members need to be present.

### → **Know your project inside and out:**

Everyone should be able to explain the full architecture, logic, and decision-making.

### → **Come prepared with a clear presentation:**

Walk the Bocal through your project like you're pitching it — not just answering questions.

### → **Be creative:**

Surprise us — whether it's with visuals, storytelling, demos, or how you structured your teamwork.
